Reasons For Allowance

The present invention is a gas turbine apparatus and operating method that provides turbine fuel control based on both speed and temperature along with power control for an electric generator driven by the turbine. Turbogenerator systems that provide speed and temperature based engine control are well known in the art as shown, for example, by any of the references cited on the PTO-892 attached to the last Office Action. None of the references of record however show or fairly suggest a turbogenerator control system which employs first and second fuel control processing units to respectively maintain a constant turbine speed and an upper combustion gas temperature limit as well as temperature-based electric generator control as specified in the claims. The claimed invention is therefore considered patentable over the prior art.
